One of the most important aspects of that is the administration of the content. The structure and the structure of the content is particularly important. Before committing to a solution, it is necessary to verify its functionality and complexity. The fact that the system is hosted on the server is of little help, for example, if a deployment is required or if you decide to use a different host. Some projects may have such an impact on the end users that there is no point in hosting a wiki internally, without the actual user being part of the solution. Therefore, what I want to say is that it is important to have a first understanding of the wiki. After this is possible, I expect the initial cost of the solution to be relatively low and that the required technical resources can be provided by yourself or your web host. When hosting the wiki internally there are a few things that must be taken into account. For the sake of simplicity, the following assumptions are made: The text and images can be read only by registered users. Both the namespaces and default style sheet should be localized to the specific language. There will be no security required to access the wiki because it is hosted internally. I assume that you have the following setup: A new installation of a Liferay portal A Liferay portal with multi-language support Assuming that you have not changed the default settings of the Liferay portal during the install and that no plugin(s) have been added to
