Fantastic Model Railroads is a community driven project inspired by the wildly popular wargame, Chivalry & Combat. You play as a Traction Company owner taking control of a small railroad serving one or more industries. You are part train driver, part industrialist. How you manage the trains and your industries will determine how successful your railroad becomes. You'll need to deal with track, switches, signal systems, wildlife, and neighborhood opposition to achieve your goals. The game offers a seamless multiplayer mode allowing players to join together in a large party or experience the game for themselves against the AI. You can experience the game solo or with other players. Fantastic Model Railroads is not a simulation, but a railroad builder. Vehicles are handled by the game engine, and not by a separate vehicle handling module. Rails are easily built and laid using the built-

in scenery editor, and transportation is accomplished by way of the scheduled train engine. For those with no background in railroad building, a tool system is available to enhance the user experience. Features Railroad construction Track Vehicles Signal systems Model industry Train handling Mixed Multiplayer Option for standalone play Scheduled train Export of models to other games Maintenance Tracks can be used to move items around your yards. Track can be used to create temporary tracks for vehicles. Tracks can be used for mucking and sweeping. Tracks can be used to transport items across your railroad. Industries can be used to turn raw materials into finished products. Traction and Electrical Systems Train braking is handled by the train, and train propulsion is handled by an engine (or a pair of engines as specified by the train's length). Trains can be driven using a third-rail system or supplied steam. There are three

unique traction types available: Electric (power from overhead trolley wires), Battery, and Steam. Power can also be supplied using a diesel generator. The electrical system for each industry controls vehicle electricity. Signal Signal systems control the amount of trains travelling from the end of the track, and the amount of trains turning onto the track. Signals can be hand built and modified by the user. Wildlife Wildlife is handled by a built-in AI behavior. The AI will attempt to follow the rules of the game and avoid traffic

### Ileal Mesenchymal Stromal Cells Protect Against Acetaminophen-Induced Toxicity: A Dual Role of Telomerase Activation and Anti-oxidative Stress.

Acetaminophen-induced intestinal injury has become a clinical problem that needs to be solved urgently. The underlying mechanism and effective therapeutic approach are not clear. We aimed to investigate the protective effect and mechanism of ileal mesenchymal stromal cells (mesenchymal stromal cells [MSCs]) on acetaminophen-induced intestinal injury. Ileal MSCs were harvested and cultured in vitro. The viability and apoptosis of ileal MSCs were measured by MTT and flow cytometry analyses, respectively. The expression of the epithelial cell markers cytokeratin 19, E-

cadherin, and zonula occludens 1 (ZO-1) in the MSCs was analyzed by reverse transcription-polymerase chain reaction. Cell cycle and expression of cell cycle-related markers were analyzed by flow cytometry. Acetaminophen (500 mg/kg) was administered to mice via intraperitoneal injection. Ileal MSCs were transplanted into mice via tail vein injection. Ileal tissues were collected for histology analysis. Ileal MSCs were transplanted into mice via tail vein injection. I
