History of AutoCAD AutoCAD's design was influenced by Matthew Reilly's 1977 U.S. patent application No. 974,978, which was approved on May 15, 1981. It introduced the concept of a "mixed language user interface", in which design information could be provided in a "low language" (the programming language of the user's choice) for rapid development of the computer's knowledge base, and in a "high language" for detailed design, such as "overview and detailed drawings". The next two decades saw a rapid evolution of AutoCAD, with products for each phase of the design process, from initial sketch to construction documentation. Originally developed for the drafting market, the software was gradually developed for use in a wide range of disciplines. Over the years, features and new capabilities were added to meet these new needs. In 1987, AutoCAD introduced cutting-edge technology with its introduction of the first design review product, which was later superseded by the ability to show changes in a project after the design review. Another milestone was AutoCAD's introduction of two-dimensional parametric technology in 1991. This advanced technology allowed simple dimensions to be placed, edited and visualized on multiple shapes. This gave an increase in productivity for many users. In 1993, AutoCAD introduced high-level design programming capabilities for the first time. These advanced the Autodesk solution to the drawing preparation process, leading to increased productivity and workflow, and the addition of new drawing elements such as object property sheets and parametric plots. In 1996, AutoCAD was introduced to the engineering market with the release of Autodesk® Inventor®. This revolutionary product enabled engineers to produce technical drawings, assemblies and machining specifications, and allowed them to build a single technical specification (T&M drawing) containing all the information needed to manufacture the product. With the introduction of Building Information Modeling (BIM) capabilities in 2001, AutoCAD became the only widely available software to bring the best of Building Information Modeling to designers and engineers. This advanced technology enabled the production of engineering drawings, assemblies and machining specifications that were built using the same data that is used to construct the physical building. In the late 2000s, AutoCAD was equipped with 3D capabilities. This resulted in the ability to build and edit 3D models directly in AutoCAD. This further increased productivity, especially with the

About Me Rob is a Technology Analyst at the Center for Digital Arts and Humanities at Rochester Institute of Technology. This blog is an outlet for his thoughts on music, technology, and other such endeavors. Thursday, March 22, 2013 This week's Top 5 Green Albums of the Week This week, I've been listening to a lot of music, but with a slight bit of a musical turn as I've been digging into the Earthship Records music collection. There are a lot of good hip hop and R&B releases out right now, so if you haven't checked them out, I highly suggest you do. However, we've got a real treat this week, so I've decided to take a swing at trying to recommend some green-oriented music.

My criteria for these selections has a little more weight than just picking the most environmentally-friendly releases, but I did take that into consideration. I've tried to pick albums that demonstrate that sustainable practices do not have to be a pain in the ass to get the product to the market. If you've got a product that is good for the environment, let's do it the right way.Q: "Error: Spawn ECONNREFUSED" when connecting to Azure Function App using Python I am trying to connect to an Azure Function App from Python. Inhibition of DNA polymerase activity of Trichobilharzia ocellata, the causative agent of schistosomiasis japonica, was observed. When adult cercariae and newly excysted cercariae were incubated in culture medium with ATP, the proportion of nucleotide pool-enriched DNA was increased, and in addition, a new form of DNA was produced, which contained a small amount of oligonucleotides and deoxyribonucleoside triphosphates (dNTPs). In the presence of ATP, the amount of the nucleotide pool-enriched DNA increased concomitantly with that of the new form of DNA. On the other hand, the amount of the nucleotide pool-enriched DNA did not increase when cercariae were incubated in the presence of GTP. When the newly excysted cercariae were incubated in culture medium containing 0.5% bovine serum albumin, a similar new form of DNA was produced. These results suggest that the new form
